## 1. [16 points] Gaussian Mixture Models &amp; EM

Consider a Gaussian mixture model with  $K$  components ( $k \in \{1, \dots, K\}$ ), each having mean  $\mu_k$ , variance  $\sigma_k^2$ , and mixture weight  $\pi_k$ . All these are parameters to be learned, and we subsume them in the set  $\theta$ . Further, we are given a dataset  $X = \{x_i\}$ , where  $x_i \in \mathbb{R}$ . We also use  $Z = \{z_i\}$  to denote the latent variables, such that  $z_i = k$  implies that  $x_i$  is generated from the  $k^{\text{th}}$  Gaussian.

- (a) What is the log-likelihood of the data  $\log p(X; \theta)$  according to the Gaussian Mixture Model? (use  $\mu_k$ ,  $\sigma_k$ ,  $\pi_k$ ,  $K$ ,  $x_i$ , and  $X$ ). Don't use any abbreviations.

Your answer:

- (b) For learning  $\theta$  using the EM algorithm, we need the conditional distribution of the latent variables  $Z$  given the current estimate of the parameters  $\theta^{(t)}$  (we will use the superscript  $(t)$  for parameter estimates at step  $t$ ). What is the posterior probability  $p(z_i = k | x_i; \theta^{(t)})$ ? To simplify, wherever possible, use  $\mathcal{N}(x_i | \mu_k, \sigma_k)$  to denote a Gaussian distribution over  $x_i \in \mathbb{R}$  having mean  $\mu_k$  and variance  $\sigma_k^2$ .

Your answer:

- (c) Find  $\mathbb{E}_{z_i | x_i; \theta^{(t)}} [\log p(x_i, z_i; \theta)]$ . Denote  $p(z_i = k | x_i; \theta^{(t)})$  as  $z_{ik}$ , and use all previous notation simplifications.

Your answer:

- (d)  $\theta^{(t+1)}$  is obtained as the maximizer of  $\sum_{i=1}^N \mathbb{E}_{z_i | x_i; \theta^{(t)}} [\log p(x_i, z_i; \theta)]$ . Find  $\mu_k^{(t+1)}$ ,  $\pi_k^{(t+1)}$ , and  $\sigma_k^{(t+1)}$ , by using your answer to the previous question.

Your answer:

(e) How are kMeans and Gaussian Mixture Model related? (There are three conditions)

Your answer:
